

Performance and Efficiency

At Paradatec, performance and efficiency are key. While this is obvious in our state-of-the-art document analysis products, it also applies to how we work. Committing to sustainability means both, creating products that require less hardware resources, and reducing power consumption and waste creation in our daily business operations.

Energy efficient software products

Green IT is more than a buzzword. Modern hardware provides more processing power per watt than ever before. Paradatec products make the most of the processing power of any hardware generation, reducing the number of servers required for a capture system by up to 75%.

And, of course, efficient document management systems significantly reduce paper use.

Reducing the environmental footprint

At Paradatec, we take pride in reducing our environmental footprint by a bundle of measures everyone commits to, such as:

Transportation

- commuting by bicycle whenever possible
- preferring the train for business trips

Lighting, cooling and heating

- office temperature control without air conditioning
- energy-saving lamps in all rooms
- “lights out” policy
- passive cooling of the server rooms
- passive solar heating
- staff education and awareness

Waste management

- using returnable bottles only
- recycling of paper and packaging
